

Ghinis Boats prepares innovative electric vessel combining its own technology and sustainable propulsion, to be unveiled at Web Summit Rio

Rio de Janeiro, April 2025 - Ghinis Boats, a promising startup in the recreational boating industry, is set to unveil the concept of its first electric-powered vessel at Web Summit Rio 2025, one of the world's leading tech conferences.

The new model will integrate Ghinis Boats' patented articulated engine mount system - a unique solution that increases onboard space and functionality - with state-of-the-art electric propulsion, aiming to deliver a revolutionary combination of innovation, performance, and sustainability.

In addition, Ghinis Boats has recently signed a partnership with racing legend Emerson Fittipaldi, who will manufacture a line of boats under his own brand using Ghinis' patented technology. The collaboration with the two-time Formula 1 World Champion and Indianapolis 500 winner brings not only visibility, but also credibility and strategic strength to the project.

"We believe the combination of our technology with electric propulsion is exactly what the market is looking for - a smarter, more sustainable, and versatile boating experience," says Jorge Ghinis, founder of the company. "Presenting this at Web Summit is an important step to connect with potential partners and take our innovation global."

About Ghinis Boats

Ghinis Boats is a nautical innovation startup developing compact, high-functionality solutions for the future of recreational boating. With a patented articulating engine mount system and a layout optimized for utility and leisure, the company is creating a new standard for space efficiency and versatility on the water.
